

## 3D print safely

Do you have a 3D printer in the office or your manufacturing area?

Particles produced during 3D printing pose a health risk. In fact, these particles are almost as harmful as the exhaust produced by Diesel motors. Ensuring the air quality at your workplace requires knowing what is in the air you are breathing.

SAXOCON provides a quick and easy solution. We can measure the air you are breathing and assess the situation in your workspace.

Our work includes:

- One on-site visit
- Conducting the required measurements
- Analysing the samples and data
- Compiling a report

This process requires little of your time, and you typically get an answer within a working week.

### Why choose us?

SAXOCON provides you with a certificate that verifies the safety of your workplace. We also design a mitigation strategy and help you implement it if the particles found around you are a risk to your health and safety. With SAXOCON as your partner, you choose the solution, not the problem.

### Delivery

SAXOCON documents all measurements and compiles all necessary results in a technical report according to and controlled by our Quality Management System.
